Numerical Method implemented

1 Numerical Methods

The numerical method currently implemented are:

- Variational Multiscale Method (VMS)
- Streamline upwind Petrov–Galerkin (SUPG)

Different solution method are available for all of them

- Non-linear (NLIN)
- Linearized-Coupled (LC-VMS)
- Linearized-Segregated (LS-VMS)

Variational Multiscale Method

1 Numerical Methods

- Evolution of the SUPG
- Implicit LES
- It does not need calibration
- Residual-based stabilization

Galerkin formulation

1 Numerical Methods

Conservation of mass:

$$\nabla \cdot \vec{u} = 0 \quad (1)$$

Conservation of momentum:

$$\frac{\partial \vec{u}}{\partial t} + (\vec{u} \cdot \nabla) \vec{u} + \nabla p - \nu \Delta \vec{u} - \vec{f} = 0 \quad (2)$$

Variational Formulation

$$B^G = \int_{\Omega} \frac{\partial \vec{u}}{\partial t} \cdot \vec{v} \, d\Omega + \int_{\Omega} (\vec{u} \cdot \nabla) \vec{u} \cdot \vec{v} \, d\Omega + \int_{\Omega} \nabla(p) \cdot \vec{v} \, d\Omega + \int_{\Omega} \nu \nabla \vec{u} \cdot \nabla \vec{v} \, d\Omega - \int_{\Omega} \vec{f} \cdot \vec{v} \, d\Omega + \int_{\Omega} q(\nabla \cdot \vec{u}) \, d\Omega = 0 \quad (3)$$

Stabilization equations

1 Numerical Methods

$$B^{SUPG}(t, (\vec{u}, p), (\vec{v}, q)) = \int_{\Omega} (\tau_m (\vec{u} \cdot \nabla \vec{v} + \nabla q) \cdot \vec{R}_m) d\Omega + \int_{\Omega} \tau_c (\nabla \cdot \vec{v}) R_c d\Omega \quad (4)$$

$$B^{VMS1}(t, (\vec{u}, p), (\vec{v}, q)) = \int_{\Omega} (\vec{u} \cdot \nabla \vec{v}') \odot (\tau_m \vec{R}_m) d\Omega \quad (5)$$

$$B^{VMS2}(t, (\vec{u}, p), (\vec{v}, q)) = - \int_{\Omega} (\nabla \vec{v} \odot (\tau_m \vec{R}_m \otimes \tau_m \vec{R}_m)) d\Omega \quad (6)$$

Stabilization parameters

1 Numerical Methods

$$\tau_m = \left(\frac{4}{\Delta t^2} + \vec{u} \cdot G \vec{u} + C_I \nu^2 G : G \right)^{-1/2} \quad (7)$$

$$\tau_c = (\tau_c \vec{g} \cdot \vec{g})^{-1} \quad (8)$$

Where G is the inverse of the gradient of the map cell. For a cubed shaped element, with h the edge length, $G_{ij} = \frac{1}{h^2} \delta_{ij}$, where δ_{ij} is the Kronecker delta.

Linearization

1 Numerical Methods

$$\tilde{\vec{u}} = 2.1875u^n - 2.1875u^{n-1} + 1.3125u^{n-2} - 0.3125u^{n-3} \quad (9)$$

$$(\vec{u} \cdot \nabla) \vec{u} \Rightarrow (\tilde{\vec{u}} \cdot \nabla) \vec{u} \quad (10)$$

Weak Scaling

2 Performances

Weak scalability: the solution time almost does not change with constant problem size per processor

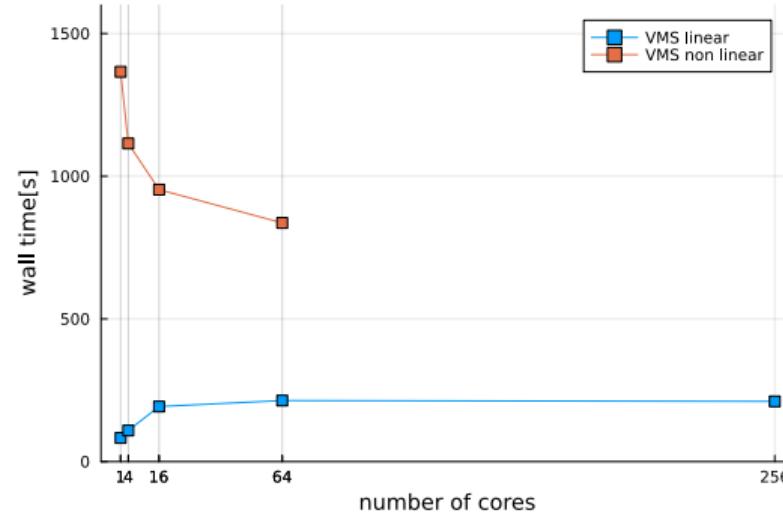

Figure: Taylor Green weak scalability

Strong Scaling

2 Performances

Strong scalability: doubling the number of processors halves the solution time

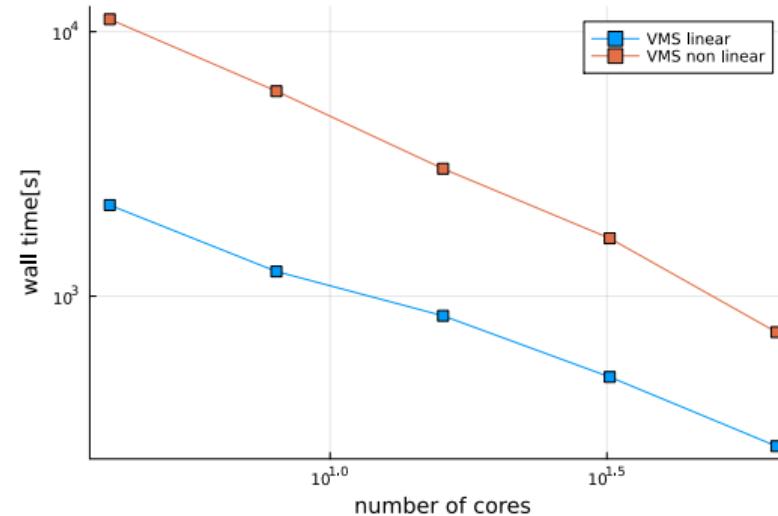

Figure: Taylor Green Strong scalability

Boundary Layer Initialization

3 Boundary Layer Initialization

- Avoid Instabilities (close to the leading edge)
- Avoid velocity ramping
- Allows Higher time-step

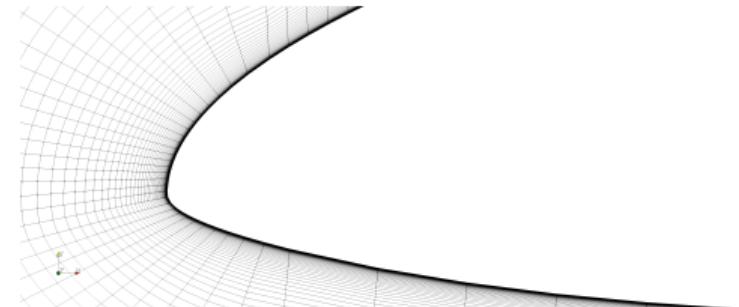

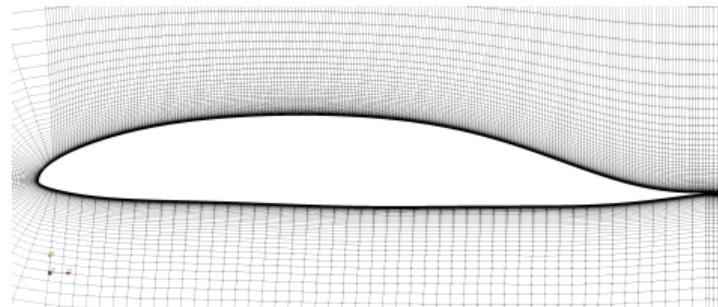

Figure: Mesh DU89

Find wall-distance

3 Boundary Layer Initialization

Using the function exploited by RANS solvers for the wall distance for computing turbulent parameters but now used to detect the airfoil's contour

$$\begin{cases} \nabla \cdot (|\nabla u_p|^{p-2} \nabla u_p) = -1 & x \in \Omega \\ u_p = 0 & x \in \Omega_D \end{cases} \quad (11)$$

The true-wall distance is provided by solving the equation for $p \rightarrow \infty$ Solved using a method that resembles Picard's

Boundary Layer Initialization

3 Boundary Layer Initialization

The velocity in the x direction in the region identified can be with a simple cubic function (12) where $dn = d/\delta_{99}$, d is the minimum distance to the airfoil, u_∞ is the free-stream flow speed.

$$f(dn) = \begin{cases} u_\infty & dn > 1 \\ (-dn^2 + 2 \cdot dn) \cdot u_\infty & dn < 1 \end{cases} \quad (12)$$

The boundary layer function has been obtained by fixing the following boundary conditions:

- Continuity with the external flow, $f(1) = 1$
- Smooth transition between boundary layer and external flow, $f'(1) = 0$
- Non-slip condition at the wall, $f(0) = 0$

Boundary Layer Initialization

3 Boundary Layer Initialization

It results in a low-speed zone close to the airfoil, avoiding high speed in really small cells useful for capturing the boundary layer.

SyntheticEddyMethod.jl

4 Synthetic Eddy Method

- publication
- presented at *JuliaCon2023* at MIT

Features:

- Create fluctuations that respect the divergence-free condition (DFSEM)
- Create velocity fluctuations for inlet boundary conditions
- Create coherent eddies in 3D domain
- Define custom Reynolds Stress Tensor
- Import from file custom Reynolds Stress Tensor

Synthetic Eddy Method

4 Synthetic Eddy Method

Reynolds decomposition:

$$\vec{u}(\vec{x}, t) = \vec{U}(\vec{x}, t) + \vec{u}'(\vec{x}, t) \quad (13)$$

Compute velocity fluctuations, using a suitable shape function:

$$u_i(\mathbf{x}) = U_i(\mathbf{x}) + \frac{1}{\sqrt{N}} \sum_{k=1}^N a_{ij} \epsilon_j^k f_{\sigma(\mathbf{x})} (\mathbf{x} - \mathbf{x}^k) \quad (14)$$

Figure: Bubble position function of freestream turbulence intensity

VMS Linearized-Segregated

5 Laminar Separation Bubble

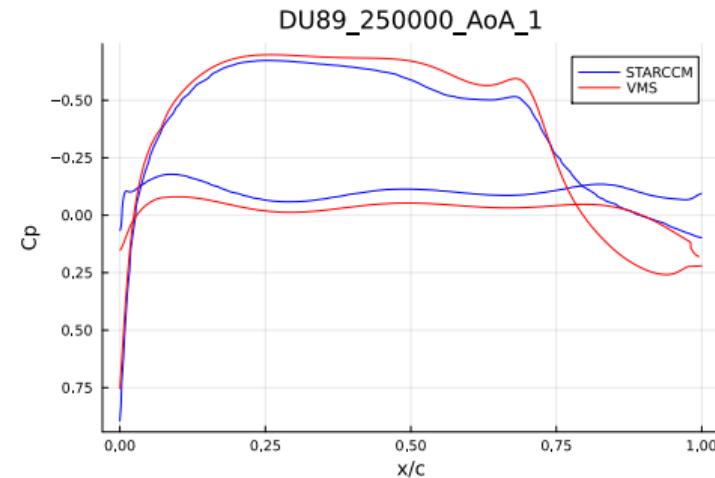

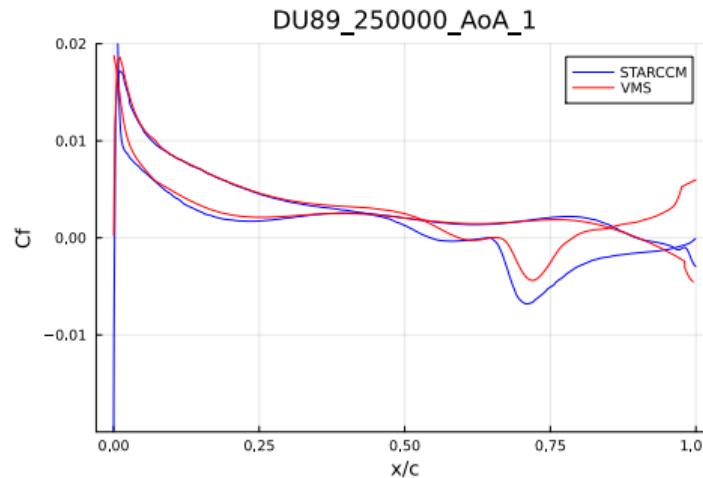

Segregated: each time step pressure and velocity system are solved one after the other multiple times. It is possible to re-use the matrices and preconditioner. It is an iterative method.

Model Variables

6 Uncertainty Quantification

RANS Re 60 000 - AoA 4° sd7003.

- $TI (\mu = 5.0 \cdot 10^{-4}; \sigma = 2 \cdot 10^{-4})$ - turbulence intensity
- $\mu_r \in [1, 10]$ - turbulent viscosity ratio

$k - \omega$ parameters:

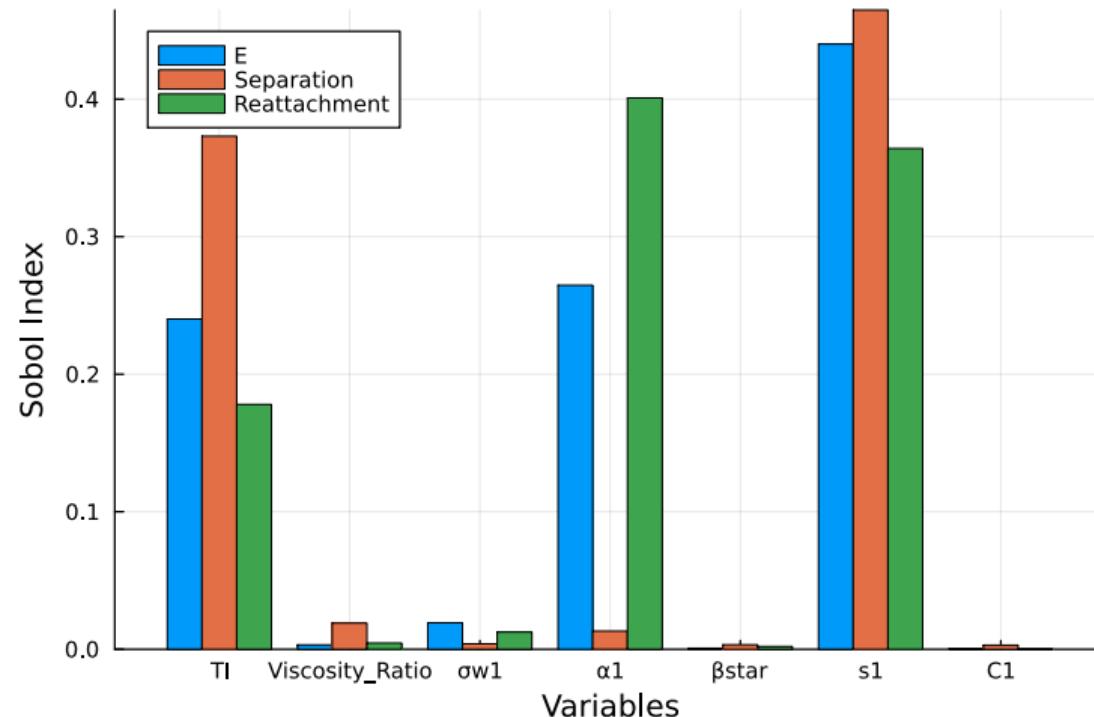

- $\sigma\omega 1 (\mu = 0.5; \sigma = 0.0667)$
- $\alpha 1 (\mu = 0.31; \sigma = 0.03)$
- $\beta * (\mu = 0.09; \sigma = 0.0041)$

γRe_θ parameters

- $s 1 \in [2, 11]$
- $C 1 \in [2, 4]$

Elements of novelty

8 Element of novelty

- Systematic usage of Julia in fluid-dynamics
- Usage of VMS for high Reynolds airfoil
- First LES code in Julia - fully parallelized - working with 3D airfoils up to $Re = 500\,000$
- Synthetic Eddy Method coded in Julia and coupled with the VMS

It has been challenging, but it seems we are on the right path!

Next steps

9 Next steps

Expected papers:

- VMS paper (prof. Janssens reading)
- Experimental validation of the LS-VMS - publish paper
- LC-VMS - (publish paper?)

Expected conferences:

- AIAA2024 conferences (LS-VMS, LC-VMS)
- DLES14 (VMS usage, validation test cases)
- ICAS2024 (Passive Flow Controls)

Expected research:

- Uncertainty Quantification using Polynomials Chaos Transformation on $\gamma - Re_\theta$ and VMS
- Start coding the adjoint optimization
- Test a passive flow control with the VMS
